High demand for local area level statistics? Time to start ...

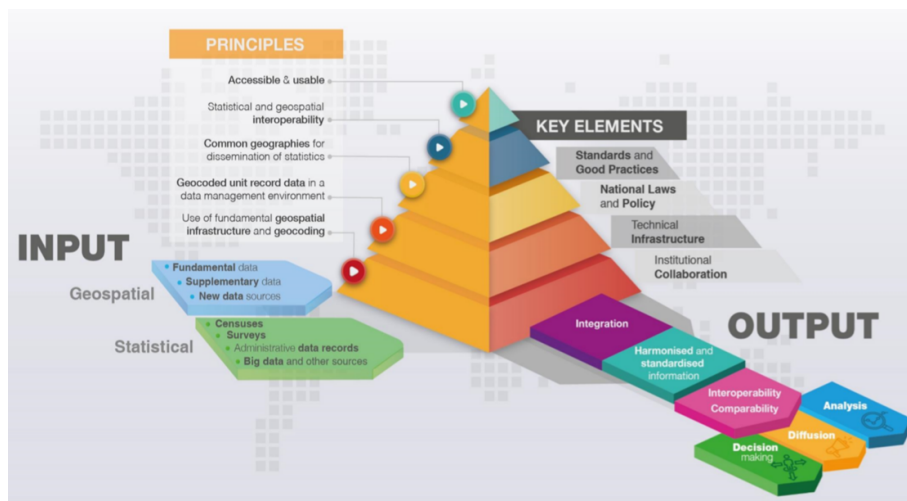

Today, an interesting paper found its way to me: "High demand for local area level statistics – how do National Statistical Institutes respond?" by Marie Haldorson from Statistics Sweden, published in 2019.

Paper indicates why statistical geospatial data integration is valuable and how a country can go about making it happen. It points out that "for National Statistical Institutes looking to improve their capability to produce statistics at the local level, the Global Statistical Geospatial Framework is a starting point that describes the requirements that need to be fulfilled."

Link to this paper is now shared on Resources page, under Integrating geospatial and statistical information.
